

Pregnancy With Morquio Syndrome - What Are Patients' Perspectives and Has ERT Changed Them?

Emory University, Decatur, Georgia, United States

The present study seeks to interview women with Morquio A and Morquio B syndrome, to explore their concerns surrounding pregnancy and the impact of ERT on their perspectives, in comparison with the control group of Morquio B subjects for whom no ERT treatment exists.

Interviews will be conducted by a health psychologist, in-person or over the telephone. Data will be analyzed using MAXQDA 12.0 software and Grounded Theory. Differences in thematic trends between Morquio A subjects, for whom treatment exists, and a control group of Morquio B subjects, for whom there is no treatment, will be compared.
